

Coping with the growing number of GMOs - towards a universal detection strategy

Arne Holst-Jensen

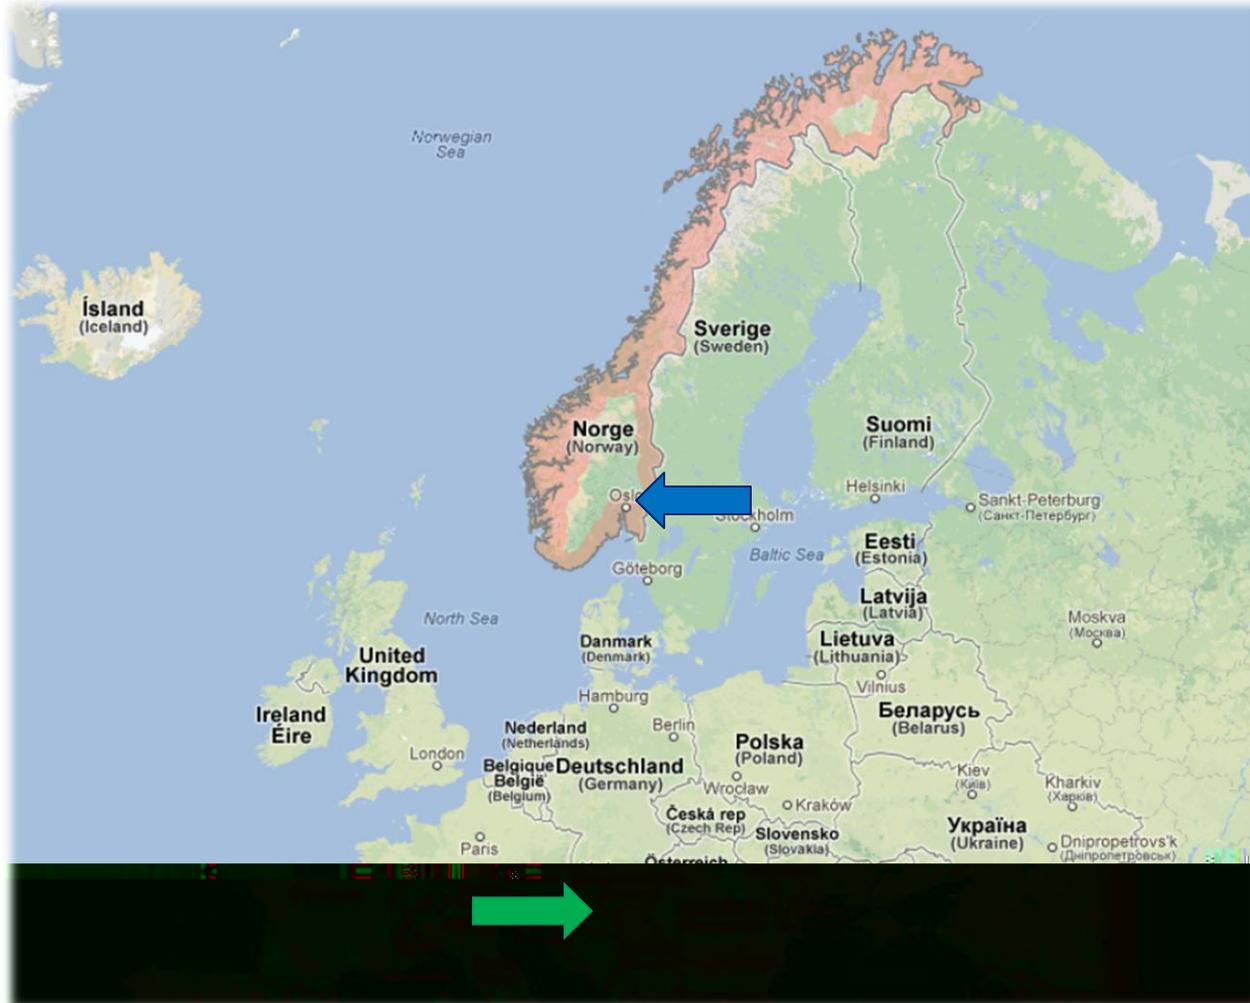

ENGL/NRL - Norway

arne.holst-jensen@vetinst.no

Veterinærinstituttet
Norwegian Veterinary Institute

Norway

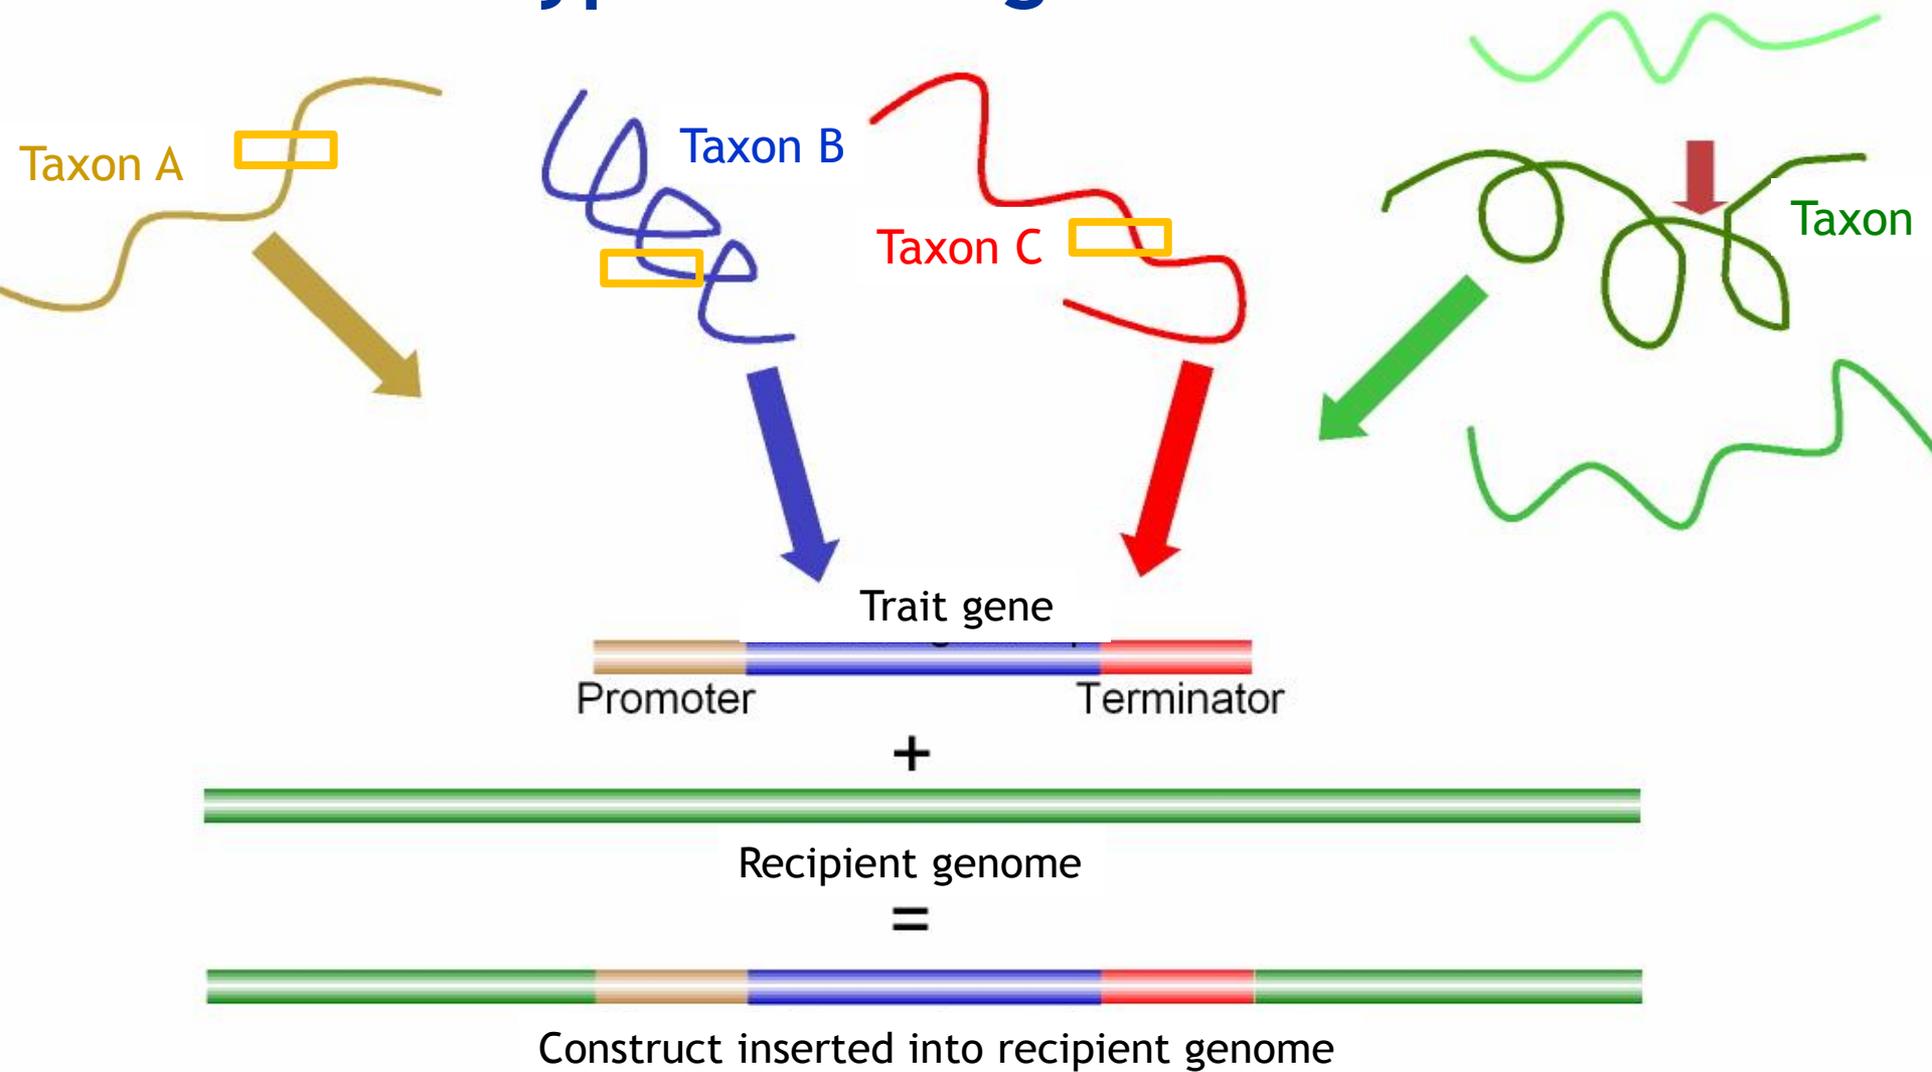

Challenges

- Increasing no's of GMOs with increasing no's of:
 - Developers: countries, universities and companies
 - Field trials organized by the developers
 - Crops subjected to genetic modifications
 - Sequenced/isolated putatively suitable elements
 - Promoters, genes, terminators + complete gene cassettes
 - Haplo-/genotypes of these elements, including synthetic
- Lack of corresponding:
 - Transparency: developments, field trials, sequences
 - Method and detection technology developments

Detection strategies (DNA-based)

- Amplification methods:
 - Simplex PCR/isothermal
 - Oligoplex and multiplex PCR/isothermal
- Detection/identification principles
 - Non-specific fluorophore (e.g. SYBR green)
 - Agarose gel electrophoresis
 - Capillary gel electrophoresis
 - Bead-/flow cytometry (e.g. Luminex)
 - Hybridisation probe (e.g. TaqMan)
 - Macro- and microarrays
 - DNA-sequencing (Sanger and Next Generation)

Typical transgenic scenario

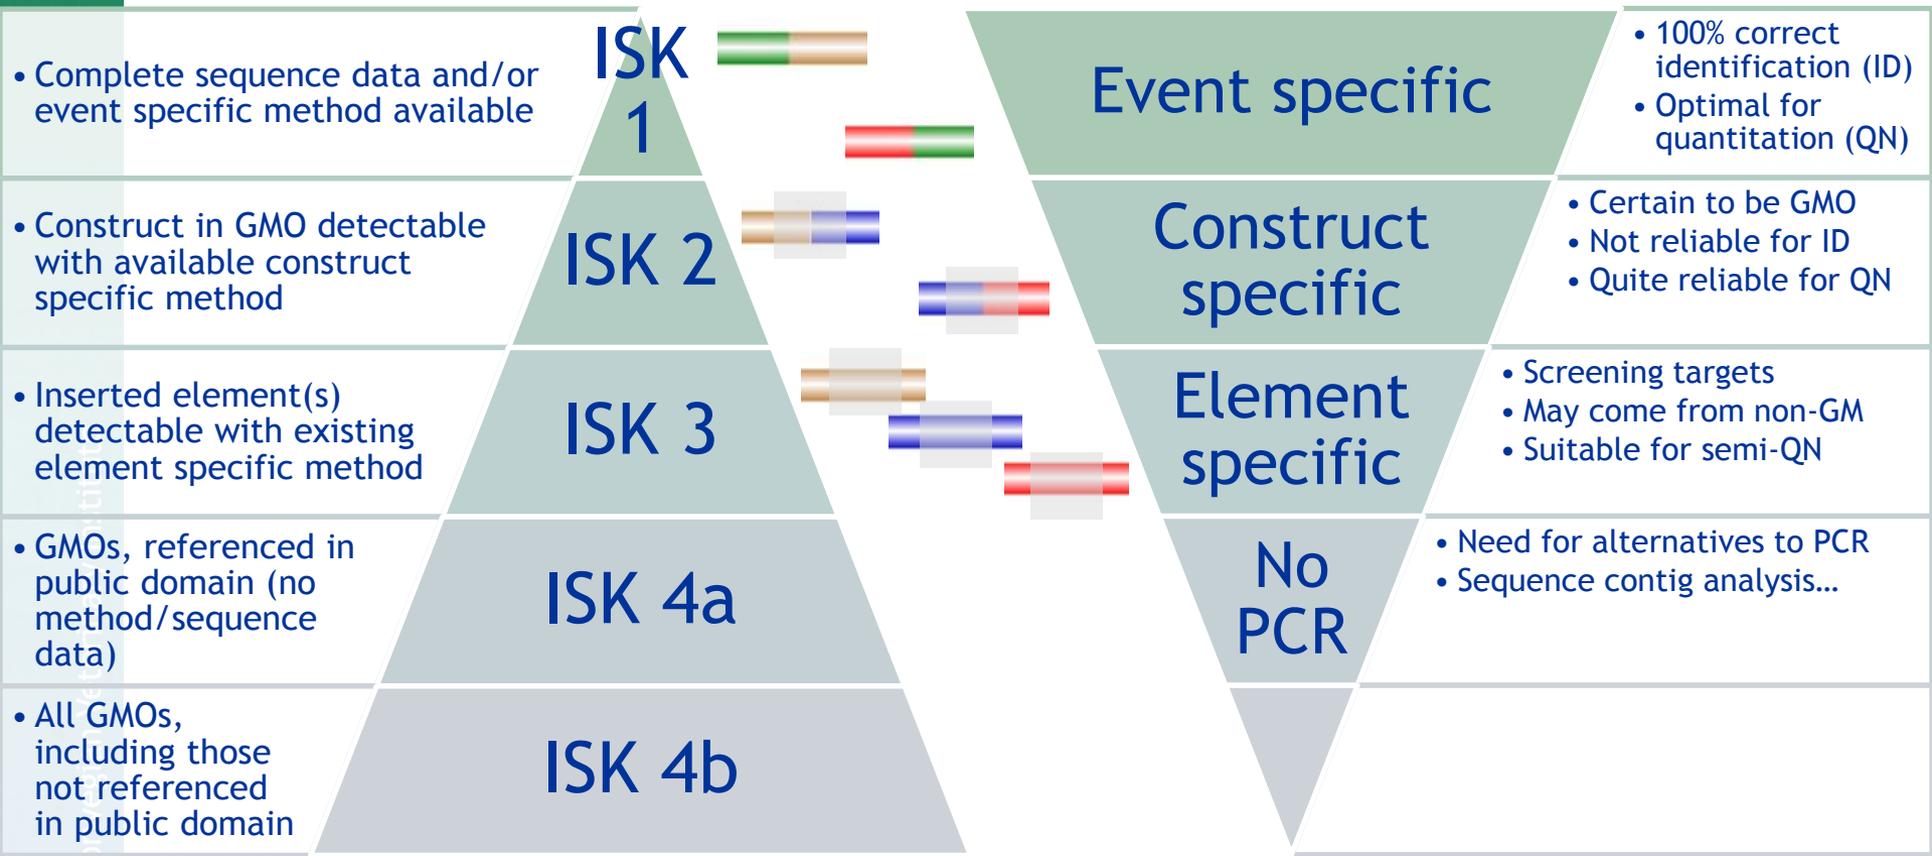

Availability of sequence information:

Insert Sequence Knowledge (ISK)-classes:

- Fully characterized GMOs (**ISK-class 1**)
- Transformed with known constructs: unknown where/if rearranged (**ISK-class 2**)
- Transformed with constructs divergent from those of ISK-class 1 GMOs but containing genetic elements present also in ISK-class 1 GMOs (**ISK-class 3**)
- Transformed with genetic elements not used in GMOs of other ISK-classes (**ISK-class 4**)

← PCR method reliability →

← Number of GMOs →

— Taxon specific

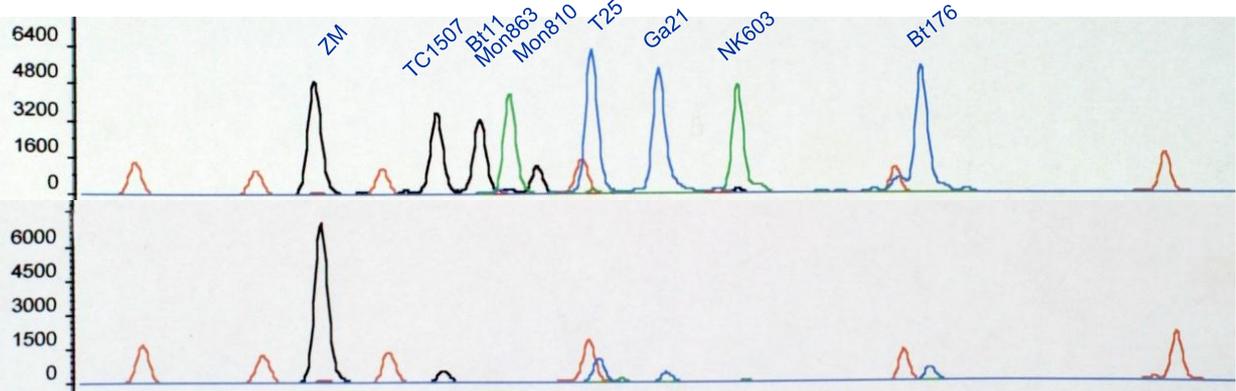

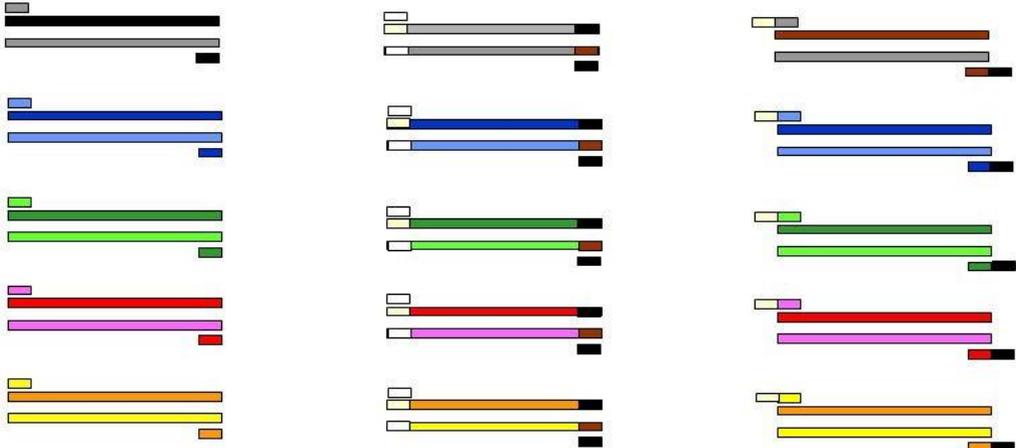

Detect (and quantify?) all events?

- Limit to dominant/declared ingredient taxa
 - Or all detected taxa?
- Interested only in authorized/unauthorized?
- Feasibility decreasing as no. of GMOs increase
 - Workload and costs may become prohibitive
- Proposed (temporary) solutions:
 - Multiplexing, incl. arrays and pre-spotted plates
 - Matrix approach targeting common elements (screen)

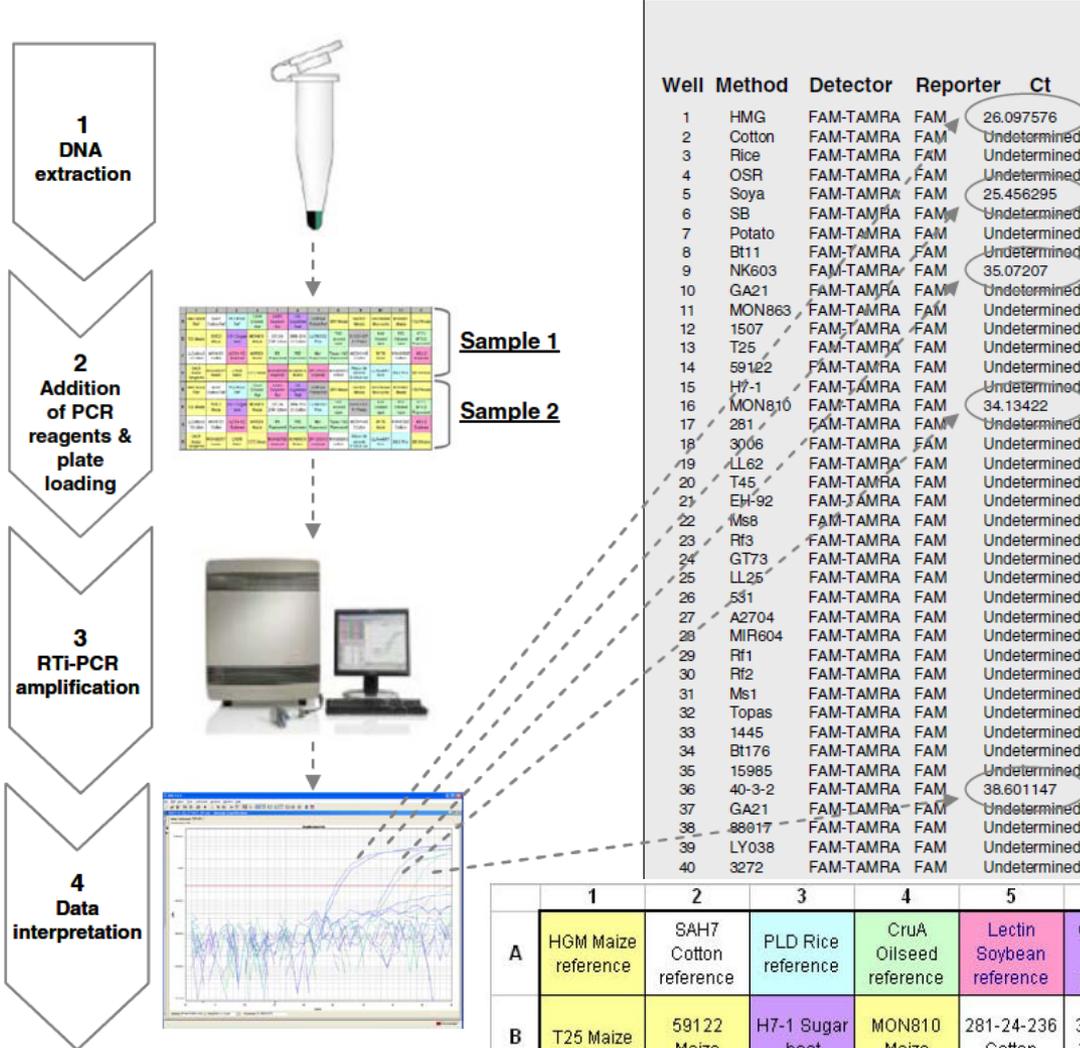

Multiplex amplification and detection

GMO screening microarray

Multiple parallel analyses

Reduce number of tests required by smart screening approach?

- Many GMOs transformed with similar constructs
 - Or at least with some of the same elements
- May also exploit other information
 - E.g. origin of sample (country, region)
- Several related concepts published
 - Each screening test must be validated for every GMO
 - With only theoretical data, risk of false negatives

High throughput sequencing

Information and method availability

- Reported GMOs
 - LMO registry of BCH under CBD
<http://bch.cbd.int/database/organisms/>
 - Competent authorities, approvals and applications
 - Literature and internet
- Methods reported in literature + databases, e.g.:
 - EU-RL GMFF gmo-crl.jrc.ec.europa.eu/gmomethods/
 - GMDD <http://gmdd.shgmo.org/>
- Sequence information:
 - EMBL/NCBI GenBank/DDBJ
 - Patent applications
 - Literature (and internet)

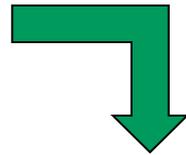

Unharmonized world

- Reporting on GMOs
 - Who reports to LMO registry of BCH, and what?
 - Nations transparent? Language can be a challenge
 - Property rights protection, intended secrecy
- Methods reported in literature + databases
 - Uncertain validation status, access ref.materials
 - Compatibility/complementarity to existing methods
- Sequence information:
 - Access to databases?
 - Quality/reliability, updating, new input to database?
 - Confidential info. for detection, not for competition

Characteristics of the transformation process

Techniques used for the modification

- Agrobacterium-mediated DNA transfer

Introduced or modified genetic elements

Some of these genetic elements may be present as fragments or truncated forms. Please see notes below, where applicable.

1-amino-cyclopropane-1-carboxylic acid deaminase - *Pseudomonas chlororaphis*
Changes in physiology and/or production - Ripening

[Record #15013](#)

Neomycin Phosphotransferase II - *Escherichia coli*
Resistance to antibiotics - Kanamycin

[Record #15001](#)

Notes regarding the genetic elements introduced or modified in this LMO

Delayed ripening tomatoes, created through introduction of a gene sequence encoding the enzyme 1-amino-cyclopropane-1-carboxylic acid deaminase (ACCD) that metabolizes the precursor of the fruit ripening hormone ethylene. The neomycin phosphotransferase II (npt II) confers resistance to the antibiotic kanamycin.

2009

6 records

45938

Genetically modified
Escherichia coli for use as DNA
'biomarker' molecules
(GMD04096)

45939

Genetically modified
Pseudomonas fluorescens for
use as DNA 'biomarker'
molecules (GMD04096)

45954

Saccharomyces cerevisiae as
modified by gene deletions in
which the open reading frame
(ORF) of a gene is replaced with
a deletion cassette module
(GMC05018)

45976

Escherichia coli (non-
pathogenic strains) modified
with 5'methylthioadenosine
nucleosidase gene from
Klebsiella pneumoniae
(GMD04022)

45979

Escherichia coli (non-
pathogenic strains) modified
with 5'methylthioadenosine
nucleosidase gene from
Pseudomonas aeruginosa
(GMD04022)

100333

Sugar cane resistant to insects

Characteristics of the transformation process

Notes regarding the genetic elements introduced or modified in this LMO

The sugar cane variety Ja.60-5 was transformed with a cry1a(b) gene to introduce resistance to insects.
No further information is available on this gene or LMO.

LMO characteristics

Common use(s)

- Food
- Feed
- Biofuel

Additional Information

Additional Information

This LMO record refers to multiple transformation events.

Search for LMOs, Genes or Organisms

On this page you can search: (i) The **LMO-Unique Identifiers Registry (LMO-UIs)**, which provides summary information on all living modified organisms registered in the BCH including transformation events, genetic modifications, and the unique identification code (if available) for each record. Links to all decisions that refer to these organisms are provided at the bottom of each LMO record accessible through the registry; (ii) The **Gene Registry**, which provides summary information on gene inserts and characteristics of the genetic modifications of LMOs; and (iii) The **Organism Registry**, which provides summary information on parental, recipient or donor organisms related to the LMOs registered in the BCH.

Choose fields as needed to narrow search results. If no category is selected to narrow the search for a particular field, a default value of "all" will be used.

What can we do to achieve a Globally harmonized detection strategy?

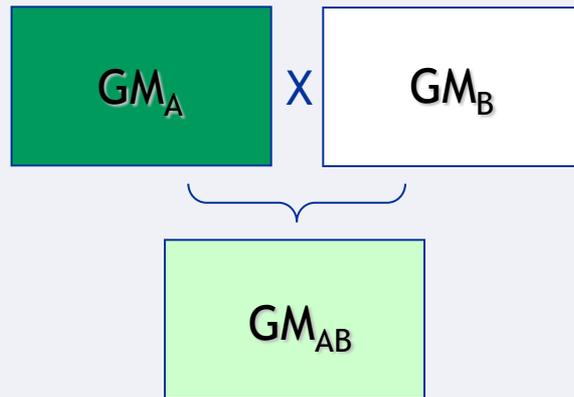

- Transparency and sharing of information on
 - What is being developed, field trials, etc.
 - Sequences or at least detailed methods
 - Reference materials (seeds, DNA, sequence info.)
- Centralized and stable depository
 - Sequence database, high quality control
 - Reference materials, capacity to provide RMs
 - Methods database, coupling sequence and RM
- ... and finally ...

Four generations of GMOs

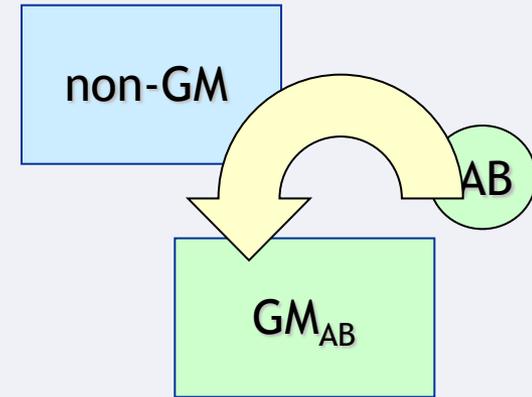

- First generation:
 - Transgene GMOs; one novel trait
- Second generation:
 - Combined transgenes (stacking)
- Third generation:
 - Near intragenic GMOs
- Fourth generation:
 - True intragenes og cisgenes

Stacking (combined GMOs)

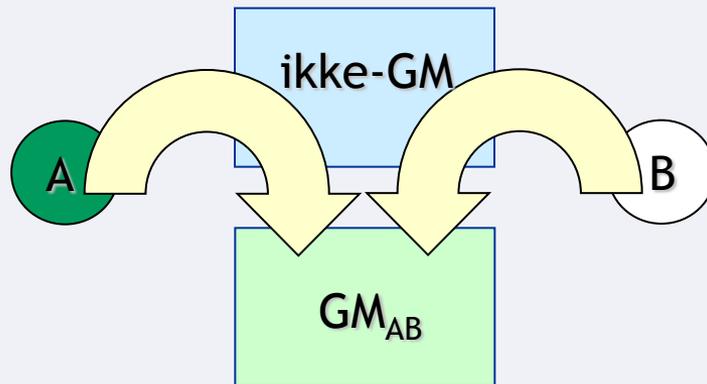

CROSSING OF 2 GMOs:

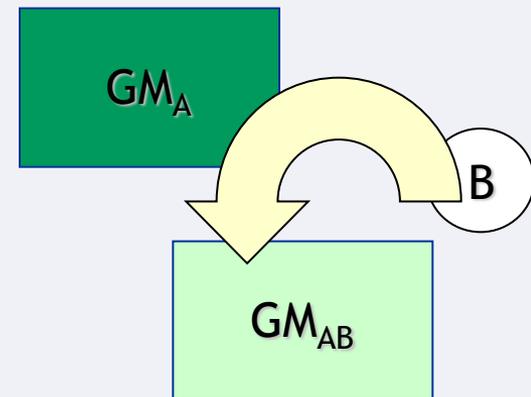

TRANSFORMATION WITH MULTI GENE CONSTRUCT:

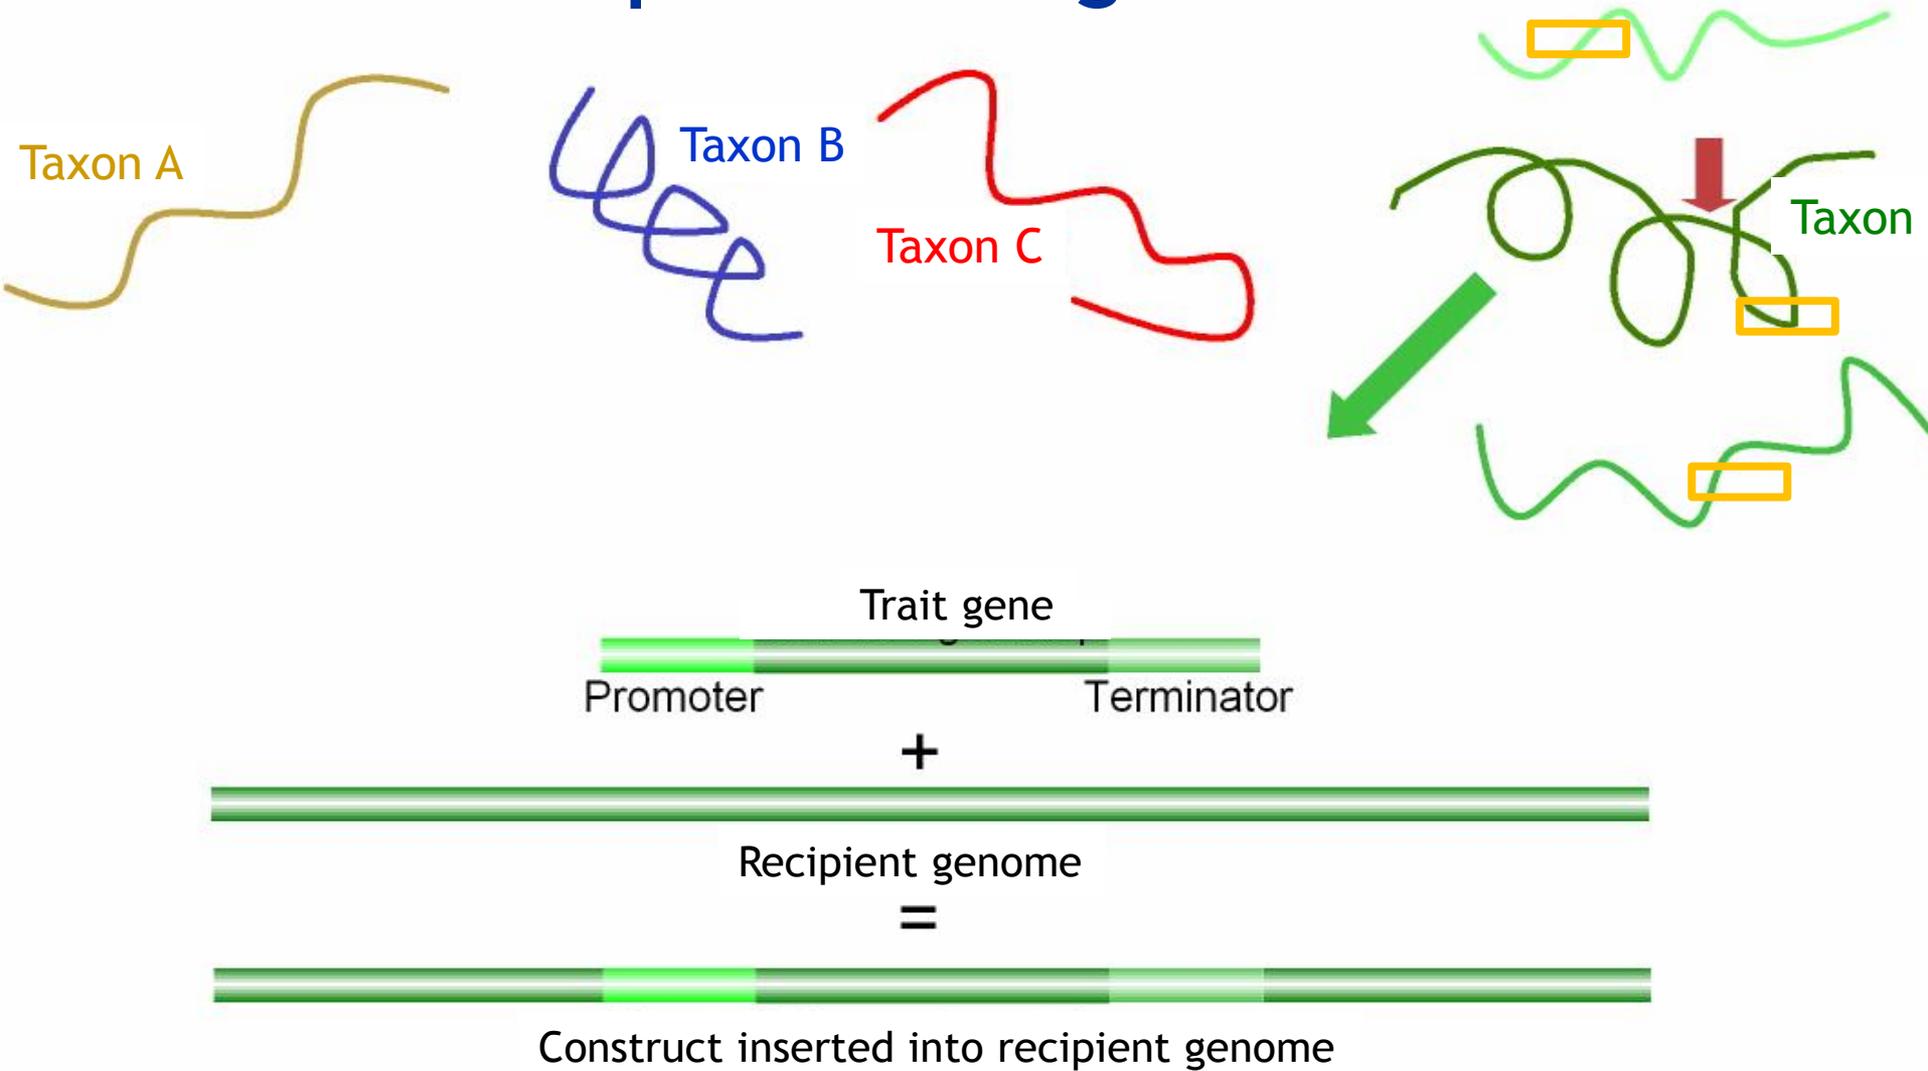

CO-TRANSFORMATION WITH TWO GENE CONSTRUCTS:

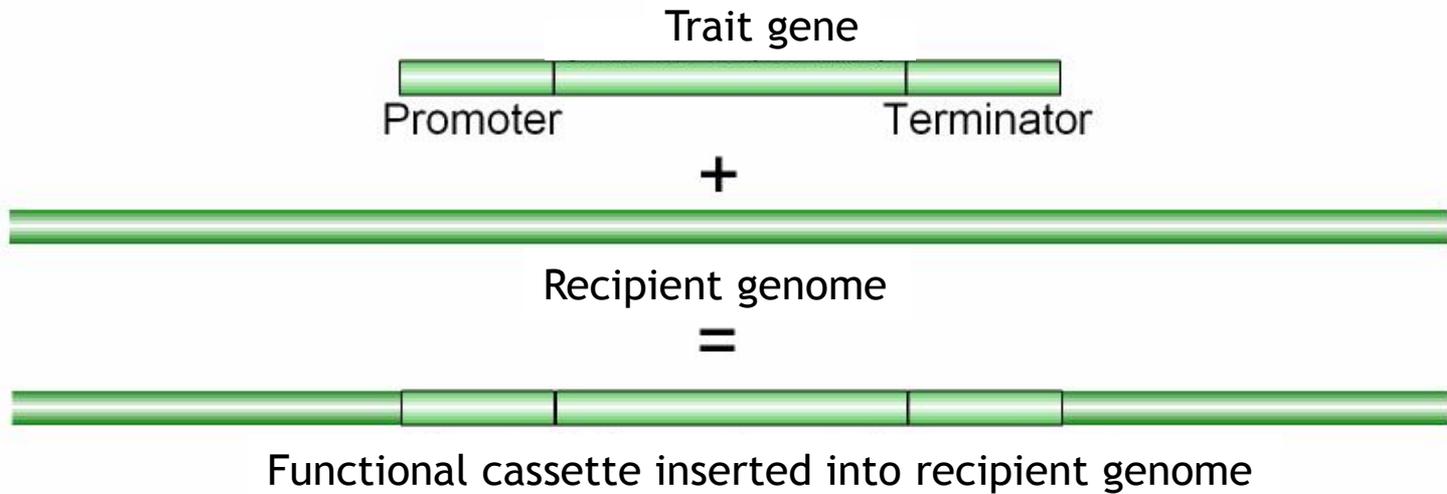

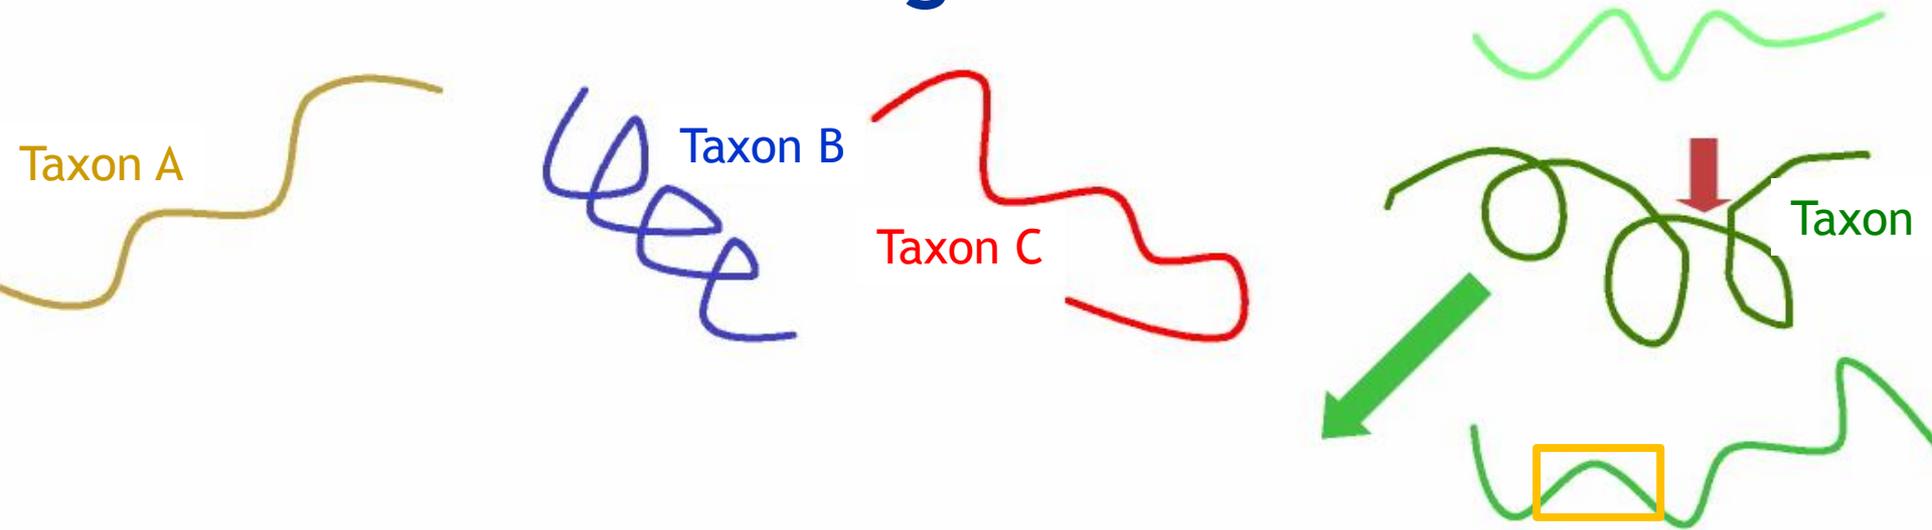

RE-TRANSFORMATION OF A GMO:

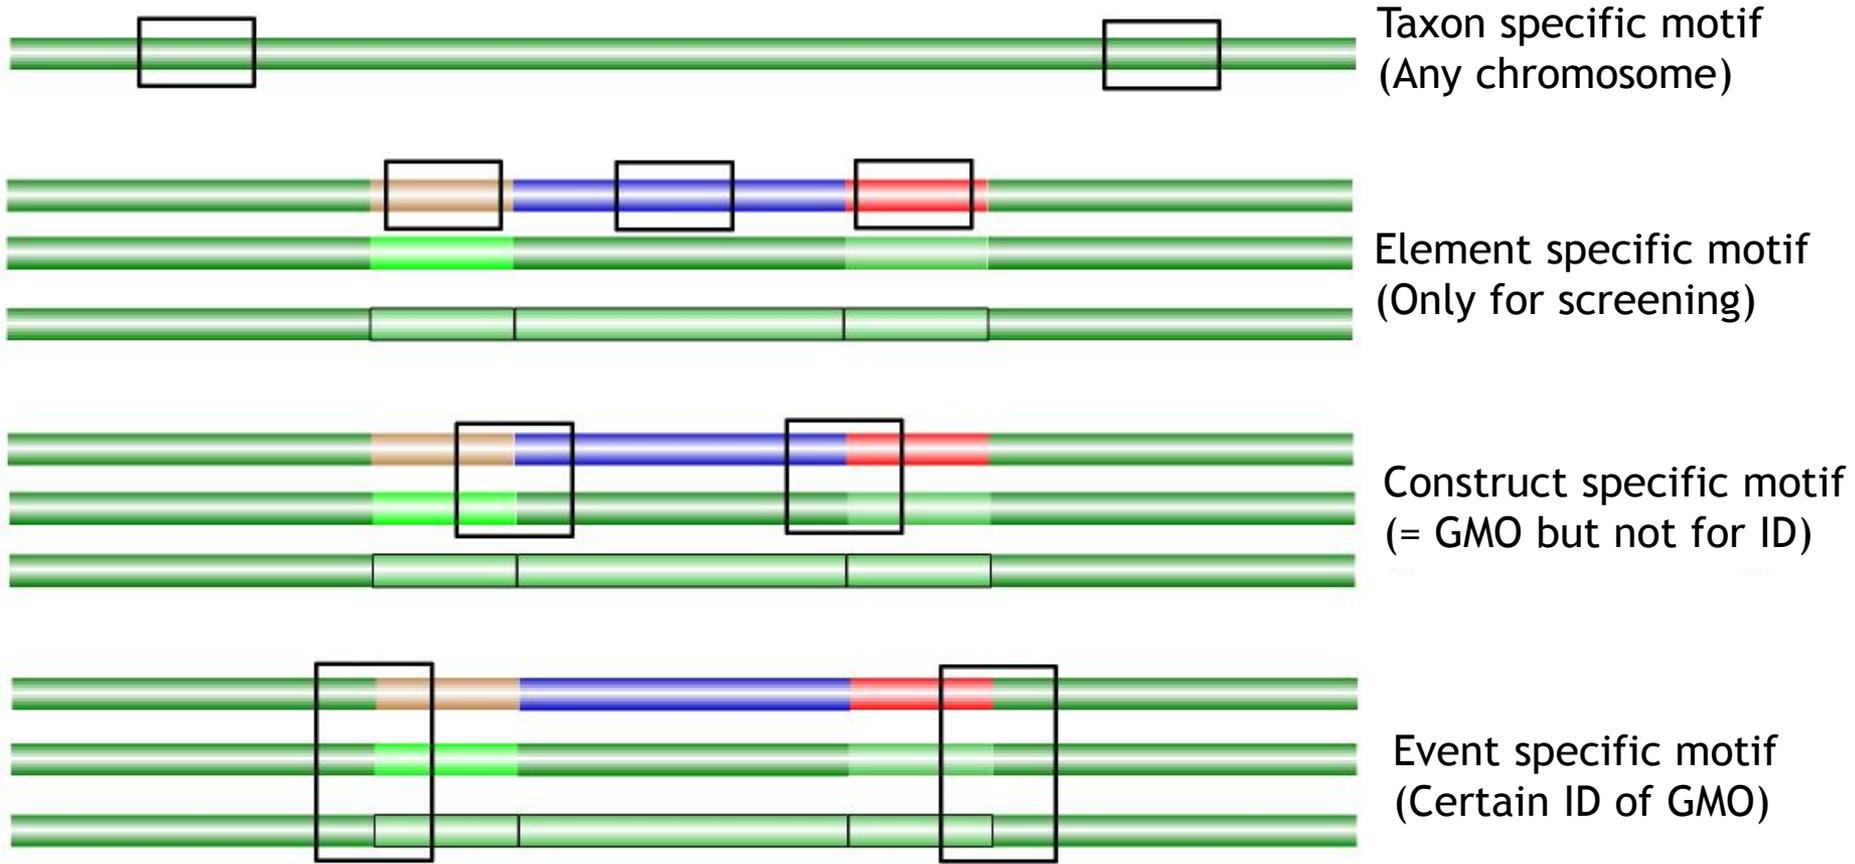

Example of intragenic scenario

True cisgenic scenario

- ISK-clas detection:
 - ISK-1: All motifs
 - ISK-2: Not “event”
 - ISK-3: Only element
 - ISK-4: **Unknown target!**

- Source based detection:
 - Transgene: All motifs
 - Intragenes: Not element
 - Cisgenes: Only “event”

What can we do to achieve a Globally harmonized detection strategy?

- Transparency and sharing of information on
